Introduction

In today's Internet-driven, knowledge-based economy, quick access to important information is critical to day-to-day business functions.

Document and content management systems now handle a wide variety of information assets, including electronic documents, audio, video, etc., and make them available to anyone with appropriate access rights, regardless of their physical location. Largely missing from this picture, however, is the ability to share paper-based information. Except for specific vertical applications (forms processing, records management, etc.), knowledge that exists on paper tends to stay on paper.

As network connected digital copiers- also known as multifunction peripherals or MFPs- become the workplace standard for department copying/printing/scanning, it is fast becoming a business requirement for MFP's to offer the additional functionality necessary to integrate with existing business applications. By offering this functionality, 3rd parties (VARs, system integrators, and office equipment dealers) are able to provide their customers a solution which links their paper documents with their enterprise applications and resulting digital processes.

“...it is fast becoming a business requirement to offer additional functionality to MFPs...”

Market opportunity

“The base of multifunction devices in the office continues to grow, creating an attractive platform onto which software developers can deploy new solutions. With software development tools, independent software developers can integrate applications to extend the use of networked office equipment.”

Cap Ventures, Software Development Programs & SDKs: The Cornerstone to Innovation in Document Solutions, February 21, 2003

Regardless of the economic climate, successful companies are continually looking for ways to leverage their existing infrastructure and applications to save money. Today, MFP “Connectors” are available to greatly enhance your current business processes by integrating paper-based information with your workflow. Using software developer kits (SDKs) 3rd parties and in-house IT departments can:

- Dynamically link digital copiers and scanners to existing applications via eCopy technology
- Save paper documents directly into application databases
- Provide native integration
- Validate users at the MFP, providing audit trails for regulatory compliance

In most companies today, paper-based information remains orphaned and isolated and is therefore subject to numerous problems:

- It is hard to locate
- It is easily lost or misplaced
- It is expensive to distribute
- It is hard to protect
- It is difficult to link to other electronic content
- It creates a broken link in the workflow

To solve these problems, businesses are increasingly turning toward scanning solutions to bring paper into the electronic domain and workflow. Once in an electronic form, documents can be located and shared easily, included in a regular offsite backup plan, and integrated with other information assets. Additionally, systems that provide scanning capabilities to the general office environment have the potential to create significant cost-saving opportunities and often pay for themselves quickly.

Scanning in the office today

Traditional analog copiers are rapidly being replaced by network-ready digital copiers. These digital devices employ the latest scanning and laser printing technology to generate ultra-sharp reproductions of paper-based originals at very high speeds. Most also support network printing, with performance and features comparable to, or exceeding, those of high-end dedicated network printers. Many also offer on-board fax transmission capabilities.

A growing number of digital copiers use the device's built-in scanner to support network scanning. Scanning takes a paper document and converts it into a digital image file that can be transmitted over a computer network or stored electronically. Until a few years ago, office scanning was limited mostly to production imaging systems and standalone desktop scanners. Now, according to a survey by InfoTrends, 34% of office workers have access to a scan-enabled digital copier.¹ Most of the major copier vendors now offer network scanning capabilities of some kind. These range from basic scan-and-mail implementations to versatile electronic document distribution systems.

"Widespread adoption (of scanning) will depend largely on simplicity, usefulness, and compatibility with existing systems and on seamless integration."

-Gartner Dataquest²

Multifunction devices of this kind are fast becoming an integral part of the office network, providing copying, printing, faxing, and scanning services to groups of users. Since these high throughput devices can be shared by a workgroup, or even a department, they provide enormous cost savings over personal or single function devices.

Analog copiers were unconnected stand-alone devices. As such, compatibility with other hardware or software applications was not an issue, and purchasing departments typically handled the acquisition of these devices. Virtually all digital copiers, on the other hand, come with a network interface, or at least provide network connectivity as an option. For this reason, corporate IT departments have become heavily involved in the selection of digital copiers. IT departments typically use a very different set of criteria to evaluate copiers. While purchasing departments generally focus on cost per page over the life of the lease, IT departments are more interested in total cost of ownership, which takes into account installation and configuration, device administration, end user training, etc. Internal IT groups are also becoming increasingly focused on interoperability - how the network connected digital copier integrates with their existing network infrastructure - to leverage their current investments in application software including Email systems, fax servers, document management systems, and workflow management applications, etc.

Business opportunity

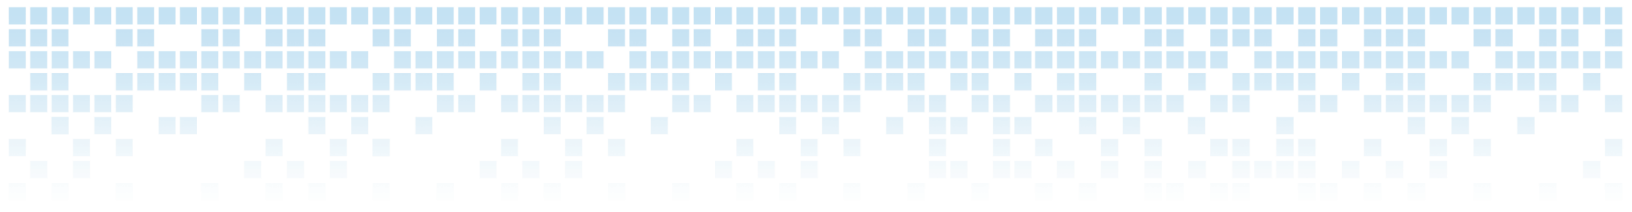

While customers are demanding ways to funnel paper documents into their existing or planned business workflows, systems integrators and enterprise application developers seek to provide the means for paper documents to be empowered by their applications.

Their motivation is simple - more people requiring access to more content equates to additional user seats and increased data storage requirements. This convergence of desires from both the user and development communities provides a unique business opportunity to deliver the functionality that makes end-to-end solutions possible. Most high-end copier vendors now recognize this, and successful vendors will either supply the solutions or provide an open architecture that enables third-party developers to plug into existing capabilities.

Businesses involved in “production scanning,” where large volumes of standard forms (mortgage applications, order forms, etc.), are familiar with the idea of document processing. For years, companies like Kofax have utilized “release scripts” to automate the process of passing documents to various backend applications. The same model can be applied just as successfully to the type of “ad hoc” scanning that takes place in virtually every office environment, but with two major differences.

While production scanning systems typically require dedicated operators trained in the complex procedures required to process documents, general office systems are designed for simplicity - user friendly, intuitive, and with a focus on ad hoc document distribution by typical office workers. Most production scanning systems do not validate the user at the copier.

A successful shift from selling hardware to deploying software-based solutions will be a critical factor in determining the future viability of a number of office equipment vendors. To remain profitable, channels must evolve their business model to focus on capturing revenue beyond the placement of office equipment.

Many factors are currently moving office equipment vendors away from their hardware-centric roots and toward a solutions focus. The most critical factors are:

- The increased sophistication of current product offerings
- The shift in customer interest toward complete document solutions
- The opportunity for increased product differentiation
- The decrease in hardware margins
- The increase in competition from traditional suppliers of networked printers

Taking advantage of this opportunity to provide solutions that connect digital copiers and scanners to business critical software applications are independent software vendors (ISVs), value-added resellers, system integrators, end users, and the office product manufacturers themselves.

“ The base of multifunction devices in the office continues to grow, creating an attractive platform onto which software developers can deploy new solutions. With software development tools, independent software developers can integrate applications to extend the use of networked office equipment.”

- CAP Ventures³

Application integration with multifunction devices

With corporate IT involvement in purchasing decisions for networked digital copiers, expectations for compatibility and network integration have risen significantly.

Instead of viewing scan-enabled devices as just “digital on-ramps” for paper documents, IT departments increasingly seek solutions that connect to their existing network infrastructure and enterprise applications, including:

- Email applications
- Network fax servers
- Document/content management systems
- Accounting or Human Resource applications
- Other networked software applications, including custom solutions developed in-house

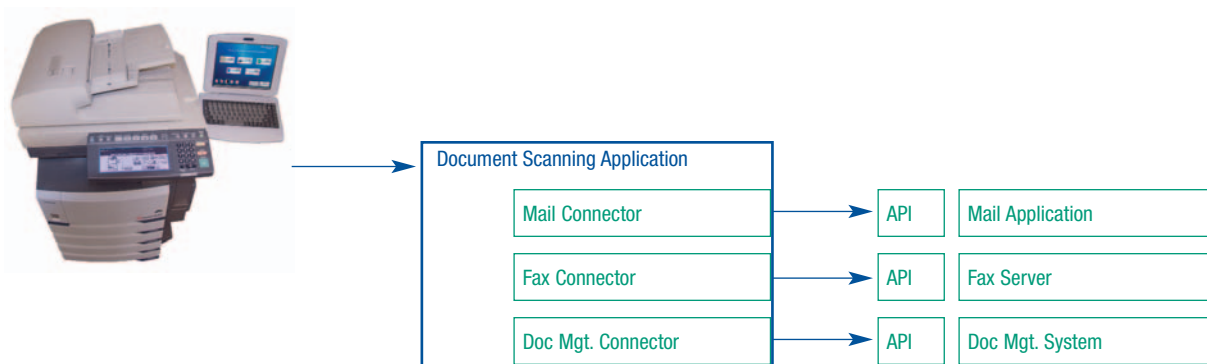

Much knowledge is still “locked” in paper, isolated from the information sharing made possible by today's electronic databases and web infrastructure. Making this knowledge accessible to employees, business partners, or customers is critical to the success of many organizations. Due to the increasing importance being placed upon this initiative by corporate senior management, businesses actively seek out solutions and vendors that support them in this goal.

Application connectors enable users to integrate paper documents into their existing electronic workflows, regardless of the backend applications that support those workflows. Through connectors that natively integrate with the specific destination applications, simple yet powerful solutions for communicating or storing paper documents are made possible.

“ As organizations focus on better leveraging existing IT investments, they will look toward low-risk, easy-to-deploy, easy-to-use solutions for improving routine document processes within the enterprise. Added value in the office equipment market will be determined by device compatibility with existing IT systems.”

- CAP Ventures⁴

Connectors provide the “middleware” that make this end-to-end processing of paper documents possible:

In such an architecture, the end user scans the document at the copier or scanner and is prompted by the scanning application to enter certain information through a control panel. The information that is collected is defined by the connector. For example, a mail connector prompts the user for his/her name, the recipient’s Email address, password, and a subject line for the mail message. A document management connector prompts the user to enter information such as document type (i.e. proposal, resumé,

or purchase order), attributes to be used for indexing, and specific location to be stored. The connector is then responsible for sending the scanned image file with any associated indexing or metadata to the backend application through its programming interface.

eCopy's role

For several years, eCopy has been the market leader in the electronic distribution of paper documents. eCopy solutions, available as add-ons for scanners and digital copiers, enable users to scan paper documents and send them electronically over the local network or the Internet.

The eCopy solutions ship with several core scanning functions, including:

- **Scan and Mail**

Delivers scanned documents using a company's existing Email system. Complete native integration with Microsoft Exchange or Lotus Notes is supported, meaning validated users can access existing server-based address lists and send documents from their personal mail account directly from the copier. Additionally, any mail server that can be configured as an SMTP server is also supported, with LDAP address book integration available.

- **Scan to Desktop**

Delivers scanned documents to a personal Scan Inbox or Windows home directory. Documents can then be retrieved using the eCopy Desktop client software, which provides comprehensive viewing and annotation capabilities, as well as integration with numerous mail, fax, and document management applications.

- **Scan and Fax**

Sends scanned documents using a company's existing network fax server. Any fax server that uses a Microsoft Exchange or Lotus Notes gateway is supported, and native integration with Captaris RightFax is also available. Internet fax services are also supported, enabling faxes to be sent and received over the Internet using an existing Email infrastructure, without any investment in fax hardware.

- **Scan to Printer**

Sends scanned documents to a remote printer anywhere on a network.

- **eCopy Quick Connect**

Bundled with the base product, the eCopy Quick Connect feature can easily automate the workflow process for scanned documents and integrate scanned documents into existing business processes. Easy to use for administrators and users, eCopy Quick Connect offers custom "Scan to" Buttons, versatile file naming, indexing, and destination options.

Sample Buttons include:

- > **Scan to HR** - resumé submission for inclusion in PeopleSoft
- > **Scan to Finance** - purchase order indexing and storage for inclusion in Great Plains
- > **Scan to Sales** - inclusion of expense reports
- > **Scan to Legal** - logging of signed NDAs and contracts for inclusion into a DM system

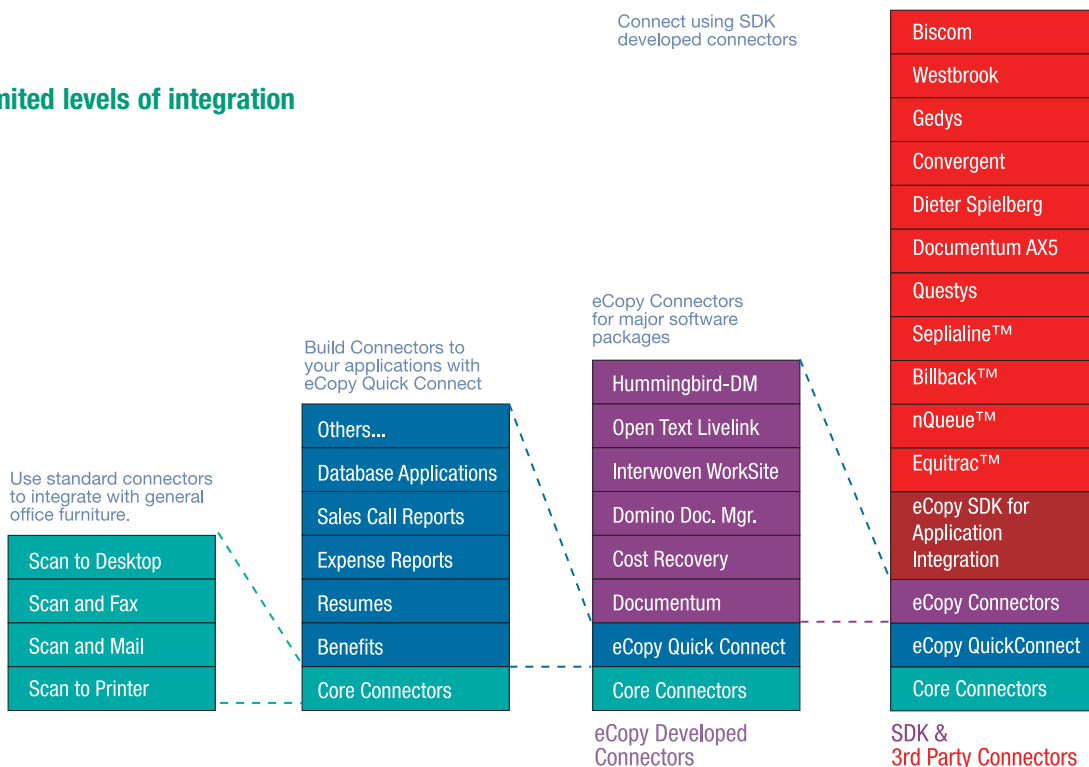

eCopy connected solutions

Today, most digital copier vendors offer basic scanning capabilities, such as scan to Email. eCopy, on the other hand, is executing on its strategy of providing customer and industry-specific solutions connecting scanners and digital copiers to customers' business critical software applications.

In addition to the core functions, eCopy and members of its developer program now offer a series of "Connectors" - add-ons that provide additional integration capabilities. These connected solutions enable paper documents to be scanned, tracked, and distributed into selected document management systems and other enterprise applications, directly from the copier or scanner.

Examples of applications supported with an eCopy Connector include Interwoven WorkSite NT, Hummingbird, EMC Documentum, and Equitrac Cost Recovery Systems. eCopy Connected Solutions enable the scanning of hard copy documents into virtually any network accessible application or service.

eCopy provides unlimited levels of integration

Software developer kit (SDK)

To better serve more comprehensive integration requirements where direct integration with the backend application is required, eCopy offers the eCopy ShareScan® OP SDK. eCopy's SDK dynamically links digital copiers or scanners into existing applications. Additionally, the SDK saves scanned documents directly into the application database and validates information for application integration. The SDK is best used when native integration to custom applications is preferred.

The eCopy ShareScan OP SDK is based upon industry standard development tools from MS Visual Studio.net and enables rapid development of a Connector linking eCopy ShareScan OP to a desired network application or service. The SDK offers the ultimate flexibility for those wishing to add paper to customer applications.

eCopy Connections Alliance Program Membership Levels and Benefits

Marketing and Sales Support	Premier	Elite
Possible co-marketing opportunities include:		
Listing and link on eCopy.com	•	•
Inclusion in eCopy marketing collateral	•	•
Inclusion in eCopy sales channel communications		•
Inclusion in eCopy press/analyst communications		•
Inclusion in eCopy sales and channel training materials		•
Joint sales calls		•
Lead generation		•
eCopy logo usage ("eCopy Compatible")		•
eCopy Partner Manager assigned as a liaison to internal eCopy groups		•
Invitation to participate in eCopy beta programs		•
Technical Support		
eCopy ShareScan SDK and eCopy ShareScan OP SDK (including eCopy ShareScan and eCopy ShareScan OP software to support Connector functional testing on a PC)	•	•
Turnkey eCopy ScanStation with eCopy ShareScan software for complete functional and user interface testing, customer support, and demonstration use	•	
eCopy ShareScan and eCopy ShareScan OP revisions and upgrades		•
SDK updates and revisions	•	•
Technical support provided by Email	•	
Technical support provided by phone and Email with guaranteed 24 hour response time		•

Summary

eCopy has positioned itself at the forefront of network scanning and electronic document distribution by offering an open, expandable architecture that can integrate with virtually any enterprise application.

For more information on eCopy and the eCopy Connections Alliance Program, please visit www.copiers.toshiba.com/ecopy.

“ eCopy starts a new era by creating a software standard which makes it possible to connect almost any digital copier or scanner to the applications of the business market leaders,” said Brian Bissett, editor of the MFP Report. “This standard permits the end-user to increase their productivity, their effectiveness, and represents a major advance for the management of documents.”
